

# Sex-specific 1-year Outcomes in Coronary Intravascular Lithotripsy

## Patient-level Pooled Analysis of Disrupt CAD Studies

**Alexandra J. Lansky, MD**

Professor of Medicine, Section of Cardiology

Yale School of Medicine, New Haven, Connecticut

Angiography & Interventions

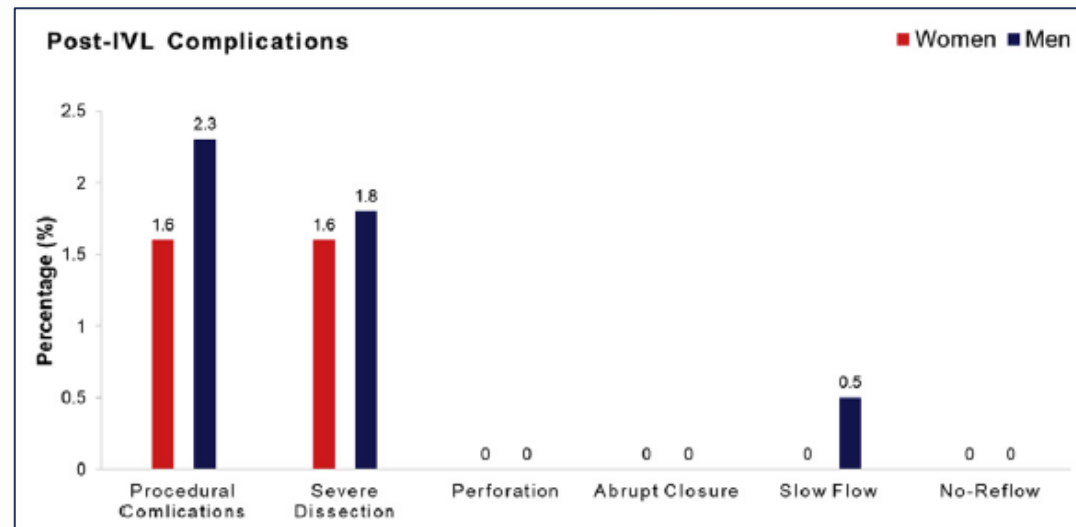

# Background

- Women with coronary artery calcification (CAC) undergoing PCI are at increased risk for adverse clinical outcomes<sup>1</sup>
- Women have high procedural complications following atheroablative treatment of calcified lesions<sup>2</sup>
- In contrast, IVL is associated with low procedural complication rates in both women and men<sup>3</sup>
- However, longer-term clinical outcomes in women following coronary IVL treatment have not been reported

RA: Increased complication rate in women

Coronary IVL: Low complication rates in women and men

# Patient-Level Pooled Analysis Design

- **Objective:** To compare sex-based outcomes of Intravascular Lithotripsy (IVL) to treat *de novo* calcified coronary lesions
- **Population:** Patient-level pooled analysis of the Disrupt CAD III-IV studies
  - Uniform study criteria, endpoints, adjudication, follow-up at 1-year
- Primary safety endpoint:
  - **30-day MACE:** Cardiac death, MI, TVR
- Primary effectiveness endpoint:
  - **Procedural success:** Successful stent delivery with residual stenosis  $\leq 30\%$  without in-hospital MACE
- Secondary endpoints at 1-year:
  - MACE
  - TLF
  - Stent thrombosis (definite or probable)

# Disrupt CAD Study Characteristics

Uniform study criteria, endpoints, adjudication, angiographic core analysis, follow-up

Characteristic	CAD III <sup>1</sup>	CAD IV <sup>2</sup>
ClinicalTrials.gov	NCT03595176	NCT04151628
Study design	Prospective, multi-center, single-arm	
Enrollment period	Jan 2019 – Mar 2020	Nov 2019 – Apr 2020
Number of patients	384	64
Number of centers	47	8
Participating regions	U.S., EU	Japan
Independent ACL and CEC	Yes	
Peri-procedural MI definition	CK-MB >3x ULN with or without new pathologic Q-wave	
Target lesions	Severely calcified*, <i>de novo</i> coronary artery lesions	
Target lesion RVD	2.5mm – 4.0mm	
Target lesion length	≤ 40 mm	
Target lesion stenosis	≥70% and <100%	
Patients eligible at 1-year	373/384 (97.1%)	64/64 (100%)

\*Radio-opacities both sides of vessel ≥15 mm length by angiography or calcium angle ≥270° by OCT or IVUS. <sup>1</sup>Hill et al., 2020; <sup>2</sup>Saito et al., 2021

# Patient Characteristics

Characteristic	Women N=106	Men N=342	P value
Age	73.9 ± 8.6	71.0 ± 8.5	0.002
Hypertension	90%	88%	0.72
Hyperlipidemia	91%	88%	0.58
Diabetes mellitus	44%	40%	0.54
Current or former smoker	45%	60%	0.002
Prior MI	14%	20%	0.26
Prior CABG	6%	9%	0.32
Prior Stroke	10%	9%	0.83
Renal insufficiency*	28%	25%	0.60

\*Defined as eGFR <60ml/min/1.73m<sup>2</sup>; eGFR=estimated glomerular filtration rate using the MDRD formula

Angiography & Interventions

# Angiographic Characteristics

Core lab adjudicated

Characteristic	Women N=106	Men N=342	P value
Target vessel			0.69
LAD	63%	58%	
LCx	11%	12%	
RCA	26%	28%	
LM	0%	2%	
Reference vessel diameter, mm	2.8 ± 0.4	3.1 ± 0.5	<0.001
Minimum lumen diameter, mm	1.0 ± 0.4	1.1 ± 0.4	0.16
Diameter stenosis	64.5 ± 11.5%	65.5 ± 10.6%	0.43
Lesion length, mm	23.6 ± 10.2	27.1 ± 11.8	0.006
Calcified length, mm	44.5 ± 16.7	49.3 ± 18.7	0.02
Severe calcification*	100%	100%	1.0
Bifurcation lesion	24%	32%	0.10

\*Defined as radiopaque densities noted without cardiac motion generally involving both sides of the arterial wall

# Conclusions

- This Disrupt CAD patient-level pooled analysis is the largest sex-based report of IVL treatment of *de novo*, calcified lesions to facilitate stent implantation with 1-year FU
- Excellent procedural safety and effectiveness outcomes to 1 year were achieved in both women and men following coronary IVL treatment
- These results contrast prior reports of high peri-procedural complications and adverse clinical outcomes in women with CAC undergoing PCI
- While additional data are needed, these results suggest that IVL can be considered first-line therapy for calcified plaque modification in women
